

ABSTRACT

An access system includes: browser software for accessing information data inputted and acquiring and reading an address of information data; a storage section for storing a specific information data address; an address replacement section for replacing the address of the inputted information data with the specific information data address stored in the storage section according to a trigger signal received from the IP network and an access section for accessing the address specified by the browser software or the address replaced by the address replacement section. Thus, the service providing side can control the redirect execution.
